

CHILDSPLAY[®] 210 SYSTEM

NB. It is important that the base for the ChildsPlay[®] System is even, of a consistent gradient and stable. Each site may vary slightly and the Authorised Supplier should assess the individual site conditions and increase the excavation and stone depth or make good the levels of a hard surface as appropriate, to take into consideration the individual site requirements. Also, if the site is not free draining, additional drainage should be included in the base preparation. The supplier will provide information of any additional works needed.
